

Ekicart®

A development of Laboratoria Smeets for treatment of osteoarthritis has been used in Australia for a dressage horse by Lord Louise. The product is marketed by Anicur.

Finean is a dressage horse of sixteen years and weighs 700 kg. In the class Light Horse, he has been very successful by winning the championship of Western Australia three years in a row. X-rays showed the presence of osteoarthritis in the knee, jump and ball and socket joints. The higher movements caused pain in the left hock joint.

Can Ekicart® provide an improvement in the clinical signs of arthritis, a chronic degenerative disease of the joints?

Ekicart® contains a broad spectrum of natural antioxidants that fight free radicals which damage the tissue permanently. The oxidative stress is reduced and the physical condition of the cartilage cells is improved. Ekicart® contains free amino acids and glucosamine as basic building blocks in the smallest possible form for cartilage, since the supply of chondrocytes occurs by diffusion from the synovial fluid. Daily layers nanometer size thick extracellular matrix are being build up. With the help of the right co-factors, this extra cellular matrix transforms into cartilage.

For three months Ekicart® was given in the evening - 50 g / day or 1 scoop. The owner is not willing to treat Finean with corticosteroids.

Afterwards, the pain in the left hock disappeared. Spurring does not cause resistance. Finean and Louise Hillman were re-selected for the dressage team of Western Australia.

Conclusion: The normal motility is found. Ekicart® is a patented nutraceutical for maintaining healthy joints and support a smooth movement system for all horses and ponies. Ekicart® is also used to meet the increased need for nutrients of the musculoskeletal system at high loads and in the growth phase.
